

Spring Cleaning with billyGO

FAUCET AERATORS

M-38424 | TACLB41879E | PATENT PENDING

Sink aerators often act similar in function to filters. Bits of dirt and other debris can build around the openings, causing the water stream to redevelop, creating pressure issues.

To keep your sink running properly, it is good practice to clean the aerator once every year.

STEP ONE

- Unscrew the cap located at the end of the faucet

STEP TWO

- Remove the rubber washer and push the inserted aerator out of the cap

STEP THREE

- In a bowl, mix three-parts water to one-part vinegar

STEP FOUR

- Submerge aerator into mixture and use a sponge to clean the area

STEP FIVE

- Blast the aerator with warm water to loosen particles, then rinse

STEP SIX

- Push aerator and rubber washer back into the cap and screw into place
