AIR VENTS & FILTERS

M-38424 | TA CLB41879E | PATENT PENDING

Air filters can accumulate a number of toxins such as dust, dirt, pollen, hair and bacteria which create potentially hazardous breathing conditions.

To rid the home of any potential septicity, it is recommended to change the air filter every quarter for a 1" filter and every six months for a 4" filter.

STEP ONE

- Unscrew vent cover and carefully remove the dirty filter, placing it directly in the trash

STEP TWO

- Use a vacuum or broom to remove all excess debris and dirt from both the cover and the outer part of the duct

STEP THREE

- Attach a hose to the vacuum to reach inside the duct and remove mold or mildew that has formed inside any cracks or crevasses

STEP FOUR

- Once clean, grab a new filter of the correct dimensions and place over the duct

STEP FIVE

- Set the cover over the clean filter and screw back into place

STEP SIX

- Use the broom to sweep any dust or dirt from the ground and enjoy the fresh air
